

**Listing of Claims:**

1. (Currently Amended) A method of ciphering call information transferred between a mobile communication terminal and a network, comprising:

transmitting a ciphering request for call information from the terminal to the network;

transmitting a ciphering authentication request message from the network to the terminal;

transmitting a ciphering authentication response message from the terminal to the network in response to the ciphering authentication request message; and

transmitting a ciphering activation completion message from the network to the terminal in accordance with the ciphering authentication response message, wherein the ciphering request is transmitted at a predetermined time during transfer of data from the terminal to the network, said predetermined time based on a timing of generation of a key value for ciphering activation.

2. (Currently Amended) The method of claim 1, wherein the ciphering authentication request message includes a RAND value and wherein the key value is generated by the terminal based on the RAND value.

3-4 (Canceled)

5. (Original) The method of claim 1, wherein the call information includes a voice information.

6. (Currently Amended) The method of claim 1, wherein the call information includes said data.

7. (Currently Amended) A method of ciphering call information transferred between a mobile communication terminal and a network, comprising:

transmitting a ciphering request message from the terminal to the network, the ciphering request message including a specific value;

computing a key value required for a ciphering activation process based on the specific value, said computing being performed by the network;

transmitting a ciphering activation completion message indicating completion of the ciphering activation process; and

ciphering the call information to be transferred between the terminal and network, wherein the ciphering request message is transmitted at a predetermined time during transfer of data from the terminal to the network, said predetermined time based on generation of a key value for ciphering activation.

8. (Currently Amended) The method of claim 7, wherein the specific value includes [[an]] a RAND value.

9-10. (Canceled)

11. (Original) The method of claim 7, wherein the call information includes a voice information.

12. (Currently Amended) The method of claim 7, wherein the call information includes said data.

13. (Original) A method of ciphering call information transferred between a mobile communication terminal and a network, comprising:

transmitting a ciphering request for call information from the terminal to the network;

determining whether a RAND value is included in the ciphering request message received by the network;

if the RAND value is included in the ciphering request message, generating a key value (Kc) required for ciphering using the RAND value, and then transmitting a ciphering activation completion message of the call information to the terminal;

if the RAND value is not included in the ciphering request message, generating a RAND value, computing/storing an SRES value, and transmitting a ciphering authentication request message to the terminal, depending upon whether ciphering activation should be performed or not;

transmitting a ciphering authentication response message including the SRES value from the terminal to the network, in response to the ciphering authentication request message transmitted from the network;

comparing the SRES value transmitted from the terminal with the SRES value stored in the network; and

determining whether ciphering of the call information is available, depending upon whether the two SRES values are equal.

14. (Original) The method of claim 13, wherein the ciphering authentication request message includes the RAND value.

15. (Original) The method of claim 13, wherein the ciphering request is transmitted by the terminal during a time when the call information is being transferred between the terminal and network.

16. (Original) The method of claim 13, wherein the ciphering request is transmitted by the terminal during a time when the call information is not being transferred between the terminal and network.

17. (Original) The method of claim 13, further comprising:  
if the received ciphering request message does not include the RAND value and ciphering activation should not be performed, transmitting a ciphering authentication unavailable message of the call information from the network to the terminal.

18. (Original) The method of claim 13, wherein the call information includes a voice information.

19. (Original) The method of claim 13, wherein the call information includes data.

20. (Currently Amended) A method of deactivating ciphering of call information transferred between a mobile communication terminal and a network, comprising:

transmitting a ciphering deactivation request for the call information from the terminal to the network at a time when ciphered data is being transferred between the terminal and network; and  
performing ciphering deactivation and transmitting a ciphering deactivation completion message to the terminal in response to the ciphering deactivation request message.

21-22. (Canceled)

23. (Original) The method of claim 20, wherein the call information includes a voice information.

24. (Original) The method of claim 20, wherein the call information includes data.

25. (Currently Amended) A method for communicating information in a mobile communication system, comprising:

transmitting a ciphering request from a mobile terminal to a network; and  
receiving ciphered information from the network or transmitting ciphered information to the network after acceptance of the ciphering request, wherein the ciphering request is transmitted at a predetermined time during transfer of data from the terminal to the network, said predetermined time based on a timing of generation of a key value for ciphering activation.

26. (Original) The method of claim 25, further comprising:  
receiving a ciphering authentication request message from the network, said message including a RAND value used as a condition for performing ciphering activation.

27-28 (Canceled)

29. (Original) The method of claim 25, wherein the ciphered information includes voice information.

30. (Original) The method of claim 25, wherein the ciphered information includes data.

31. (Original) The method of claim 25, wherein the ciphered information includes at least one of SMS information, SS information, and PDP context activation information.

32. (Currently Amended) A method for communicating information in a mobile communication system, comprising:

receiving a ciphering request from a mobile terminal; and

transmitting ciphered information to the terminal or receiving ciphered information from the terminal in response to the ciphering request, wherein the ciphering request is received at a predetermined time during transfer of data from the terminal to the network, said predetermined time based on a timing of generation of a key value for ciphering activation.

33. (Original) The method of claim 32, further comprising:  
transmitting a ciphering authentication request message to the terminal, said message including a RAND value used as a condition for performing ciphering activation.

34. (Original) The method of claim 32, wherein the ciphering request is received when call information is being transferred between the terminal and network.

35. (Original) The method of claim 32, wherein the ciphering request is received when call information is not being transferred between the terminal and network.

36. (Original) The method of claim 32, wherein the ciphered information includes voice information.

37. (Original) The method of claim 32, wherein the ciphered information includes data.

38. (Original) The method of claim 32, wherein the ciphered information includes at least one of SMS information, SS information, and IPDP context activation information.

39. (Currently Amended) A communications terminal, comprising:  
a transceiver which transmits a ciphering request to a mobile network; and

a processor which processes ciphered information received from the network or ciphers information to be transmitted to the network after acceptance of the ciphering request, wherein the transceiver transmits the ciphering request at a predetermined time during transfer of data from the terminal to the mobile network, said predetermined time based on a timing of generation of a key value for ciphering activation.

40. (Original) The terminal of claim 39, wherein the information includes at least one of voice information, data, SMS information, SS information, and PDP context activation information,

41. (Currently Amended) A mobile communications network controller, comprising:  
a receiver which receives a ciphering request from a mobile terminal; and  
a processor which ciphers information to be transmitted to the terminal or receives ciphered information from the terminal in response to the ciphering request, wherein the receiver receives the ciphering request at a predetermined time during transfer of data between the terminal and the network, said predetermined time based on a timing of generation of a key value for ciphering activation.

42. (Original) The terminal of claim 41, wherein the information includes at least one of voice information, data, SMS information, SS information, and PDP context activation information.

43. (Currently Amended) A computer-readable medium storing a program for communicating information in a mobile communications system, the program comprising:

a first code section which controls transmission of a ciphering request from a mobile terminal to a network; and

a second code section which processes ciphered information received from the network or ciphers information to be transmitted to the network after acceptance of the ciphering request, wherein the first code section controls transmission of the ciphering request a predetermined time during transfer of data from the terminal to the network, said predetermined time based on a timing of generation of a key value for ciphering activation.

44. (Currently Amended) A method for communicating information in a mobile communication system, comprising:

receiving an input signal for terminating ciphering of call information; and

transmitting a ciphering deactivation request from a mobile terminal to a network in response to the input signal, wherein the ciphering deactivation request is transmitted at a time when ciphered data is being transferred between the terminal and network

45. (Original) The method of claim 44, wherein the signal is generated by user input.

46. (Original) The method of claim 44, wherein the call information includes at least one of voice information, data, SMS information, SS information, and PDP context activation information.

47. (Currently Amended) A method for communicating information in a mobile communication system, comprising:

receiving a ciphering deactivation request from a mobile terminal at a time when ciphered data is being transferred between the terminal and network; and

terminating ciphering of call information to be transmitted to the terminal.

48. (Original) The method of claim 47, wherein the call information includes at least one of voice information, data, SMS information, SS information, and PDP context activation information.

49. (Currently Amended) A communications terminal, comprising:  
a processor which generates a ciphering deactivation request; and  
a transmitter which transmits the request to a mobile network at a time when ciphered data is being transferred between the terminal and network.

50. (Original) The terminal of claim 49, wherein the processor generates the request in response to a user input.

51. (Currently Amended) A mobile communications network controller, comprising:  
a receiver which receives a ciphering deactivation request from a mobile terminal at a time when ciphered data is being transferred between the terminal and network; and  
a processor which terminates ciphering of call information to be transmitted to the terminal.

52. (Original) The controller of claim 51, wherein the call information includes at least one of voice information, data, SMS information, SS information, and PDP context activation information.

53. (New) The method of claim 1, wherein the ciphering request is generated and transmitted without including a RAND value for ciphering activation.

54. (New) The method of claim 1, further comprising:  
transmitting a ciphering deactivation request message from the terminal to the network during at a time when ciphered data is being transferred between the terminal and network.
